- Esteemed judges for Final Round (Dr Leek, Dr Lim, Mr Roy)

General Remarks by HQM

General Remarks

We want everyone who came to AC to take away something.

Different format of questions, but same goal: introduce something in Astronomy

Several important points:

- Science is a way of thinking.
- Mathematics is a language of astronomy (and many other sciences and social sciences in general).
- Analytical skills goes a long way.

Science as a way of thinking

5. What is the motivation behind the theory of general relativity? How did it turn out to be a better encompassing theory about the universe? Are our previous understandings of gravitation still relevant to us today?
15. What are the geocentric and heliocentric models? Why was the geocentric model superseded by the heliocentric model, which was subsequently superseded by newer models?

11. In 1588, Tycho Brahe published the Tychonic system, which is a geoheliocentric model in which the Sun, the Moon and stars revolve around the Earth, and other five planets (Uranus and Neptune were not yet discovered) revolve around the sun.

Back when it was proposed, it was a major competitor, along with the Copernican heliocentric model, as an alternative to the Ptolemy's geocentric model.

However, the scientific community eventually replaced the Tychonic model with the Copernican model. Which one of the following observations could have contributed to the support for Copernicus' heliocentric model **over the Tychonic model**?

- (A) The observed seasonal change of the declination of the Sun on the celestial sphere.
- (B) The observation of the retrograde motion of Mars.
- (C) The observation of the phases of Venus in 1610.
- (D) The observation of stellar parallax of 61 Cygni in 1838.
- (E) All of the above.

Ongoing process of scientific inquiry

Mathematics as a language

Assuming that bodies involved in the collision are point mass and there was no other loss of energy, Milo tried to calculate the final mass of the remnant. This is his working:

Since the orbit is circular,

$$e = 0 \quad (2)$$

$$a = 300 \text{ km} \quad (3)$$

Using Equation 1,

$$P_{\text{loss}} = \frac{32G^4 m_1^2 m_2^2 (m_1 + m_2)}{5c^5 a^5 (1 - e^2)^{7/2}} \left(1 + \frac{73}{24} e^2 + \frac{37}{96} e^4 \right) = \frac{32G^4 m_1^2 m_2^2 (m_1 + m_2)}{5c^5 a^5} \quad (4)$$

$$E_{\text{loss}} = P_{\text{loss}} t = \frac{32G^4 m_1^2 m_2^2 (m_1 + m_2) t}{5c^5 a^5} \quad (5)$$

$$E_{\text{remaining}} = \frac{0.975}{0.025} E_{\text{loss}} = \frac{0.975}{0.025} \times \frac{32G^4 m_1^2 m_2^2 (m_1 + m_2) t}{5c^5 a^5} \quad (6)$$

$$M_{\text{remaining}} = \frac{E_{\text{remaining}}}{c^2} = \frac{1}{c^2} \times \frac{0.975}{0.025} \times \frac{32G^4 m_1^2 m_2^2 (m_1 + m_2) t}{5c^5 a^5} = 5.12 \times 10^{27} \text{ kg} \quad (7)$$

However, it turned out that the actual mass of the remnant is $5.45 \times 10^{30} \text{ kg}$.

- (d) One of the key steps above contained a mistake, which resulted in the disparity in the calculation outcome. Which step is it? Explain why it is a mistake. [1]

Note that there is no mistake in the numerical calculation. You may use the equation number to refer to the step.

Solution:

Equation 3 contains a mistake. [0.5]

The mistake is that the semi-major axis is constant throughout the merger process.

As the stars collide, the semi-major axis of their orbit, a , decreases from 300 km to 0. So it does not make sense that $a = 300 \text{ km}$ throughout the entire process. [0.5]

- (e) What is one technique that you can use to correct for this mistake? Qualitatively explain how this technique will be helpful. [1]

Solution:

We should account for the change of semi-major axis throughout the merger process by seeing $a(t)$ as a function of t . [0.5]

We can then use the technique of integration to account for the change in $a(t)$. [0.5]

Specifically, once we write $a(t)$ as a function of t , now we have $-\left(\frac{da}{dt}\right)$ as a function of t . That is, we have power loss $P_{\text{loss}}(t)$ as a function of t . Then, in step 5, we can find the total energy loss by

$$\int P_{\text{loss}}(t) dt$$

Mathematical methods are handy tools in handling tricky situations.

Mathematics as a language

Now, let the time it takes for recombination to happen after the formation of the first acoustic wave be t_r , and the distance travelled by the wave until recombination be l_r .

Cornelius interjects and gets ahead of himself. “Based on my knowledge of advanced mathematics, we can write l_r as

$$l_r = c_s \int_0^{t_r} \chi(t) dt$$

where $\chi(t)$ account for cosmological expansion of the universe over time.”

“Bravo Cornelius! Amazing observation. However, there is one inaccuracy.”

(j) What is the inaccuracy here?

[1]

Hint: Refer to part (g) for hint. I must admit this is more of a mathematical question than a physical one, however we all must respect mathematics, nonetheless.

Solution:

The speed of sound in Cornelius' expression is assumed to be constant. However, from part (g), we know that the speed of sound was decreasing as time passed on due to changing densities. Therefore, c_s must be inside the integral sign in the expression, i.e.,

$$l_r = \int_0^{t_r} c_s(t) \chi(t) dt$$

Analytical Skills goes a long way

- (a) By considering how the energies of a satellite of mass m , in a bound orbit around a central point mass of mass M , at its apoapsis and periapsis⁷, show that Josh can derive Equation 19. [1]

$$\frac{1}{2}v_a^2 - \frac{1}{2}v_p^2 = \frac{GM}{r_a} - \frac{GM}{r_p} \quad (19)$$

where

- v_a is the velocity of the satellite at apoapsis
- v_p is the velocity of the satellite at periapsis
- r_a is the distance between the satellite and the central point mass at apoapsis
- r_p is the distance between the satellite and the central point mass at periapsis

Solution:

We start off with the expression for the total energy of a satellite in an elliptical orbit at any point as the sum of its KE and GPE: [0.5]

$$E = \frac{1}{2}mv^2 - \frac{GMm}{r}$$

Since the total energy in an elliptical orbit is conserved, we can equate the energies at periapsis and apoapsis, thus forming the equation: [0.5]

$$\frac{1}{2}mv_a^2 - \frac{GMm}{r_a} = \frac{1}{2}mv_p^2 - \frac{GMm}{r_p}$$

which can be simplified to:

$$\frac{1}{2}v_a^2 - \frac{1}{2}v_p^2 = \frac{GM}{r_a} - \frac{GM}{r_p}$$

Sees “considering how the energies...”

Conservation of energy?

Closed system?

$$TE_a = TE_p$$

VERY IMPORTANTLY

You NEED to recognise others' work (including AI)

- It is never a shame to give credit to others, in fact, it is very noble to do so.
- New intellectual discovery depends on others' previous work. It would be VERY WEIRD if you do not refer to other sources.
- AI is becoming more and more powerful day by day. We follow NTU's guideline on AI usage - you NEED to declare properly if it is used.

Just to make it clear...

- We DO NOT penalise if you cite sources. There is no maximum amount of source we impose so cite as many as you have referred to!
- We DO NOT penalise on AI usage if you have declared it properly. Use AI when it helps you and do not use it when it hinders you, and declare it!

VERY IMPORTANTLY

We penalise if

- Citation is improper - we do not require it to be as rigorous as it needs in academic writing. However, there should not be cases where the word description says article A but the link leads to article B.
- AI declaration is improper - you will see some examples.
- The poster you bring is not the same as you submitted electronically.
- Clear signs of plagiarism either from others' work or from AI.

Interesting posters

Q8: WHAT IS THE OLBER'S PARADOX?

Basic definition: Olber's paradox is about the darkness of the night sky. If the universe is endless and uniformly populated with luminous stars, then every line of sight must eventually reach a star.

HOW DID THE PARADOX COME ABOUT?

This paradox was mentioned in 1823 by the German astronomer Heinrich Wilhelm Olbers, and its discovery is attributed to him. The problem can be traced back to Kepler in 1610, who used it as an argument against the notion of an infinite universe containing an infinite number of stars.

SOME ASSUMPTIONS!!!

1. The universe is infinite in extent.
2. Stars are uniformly distributed throughout space.
3. The universe is static and eternal (unchanging with time).
4. Light travels forever without being absorbed.

If all of these were true:
• Every line of sight would eventually land on a star.
• The whole sky should be bright like the surface of the Sun.

SOLUTIONS

FLUX

- Imagine the universe as shells, each 1 light-year thick.
- Distant shells have more stars but stars appear dimmer.
- Result: Each shell contributes equal light, so an infinite number of shells → infinite brightness.
- Resolved by:
 - The universe has a finite age (13.8 billion years).

LINE-OF-SIGHT

- In an infinite, static universe, any line of sight should end on a star.
- So the sky should be fully lit.
- Resolved by:
 - The universe is expanding, causing light to redshift.
 - We see only as far as the surface of last scattering (cosmic microwave background).

Stars with a story

Time travel

The solution involves looking back in time — since light takes time to travel, we can only see a limited part of the universe. We're always looking into the past.

Olber's paradox is a major supporting evidence of the big bang theory!

Q: How many fonts did you use?

A: YES

ASTROCHALLENGE 25

new drake equation?!?! 

what even is the drake equation tho

The Drake Equation states that:

$$N = R_* \cdot f_p \cdot n_e \cdot f_i \cdot f_l \cdot f_c \cdot L$$

Where:

- N : the number of civilisations in the Milky Way galaxy with which communication might be possible
- R_* : the average rate of star formation in our Galaxy
- f_p : the fraction of those stars that have planets
- n_e : the average number of planets that can potentially support life per star that has planets
- f_i : the fraction of planets that could support life that actually develop life at some point
- f_l : the fraction of planets with life that go on to develop intelligent life (civilizations)
- f_c : the fraction of civilizations that develop a technology that releases detectable signs of their existence into space
- L : the length of time for which such civilizations release detectable signals into space

The equation was first developed to estimate the number of advanced civilisations likely to exist in the Milky Way galaxy. So, how could we modify it to predict the number in the universe?

New drake equation:

$$N = S_n * F_s * H_p * F_l * F_i * F_t * P_d$$

Where:

- N : the number of civilisations in the universe with which communication might be possible
- S_n : the number of stars in the Milky Way
- F_s : the fraction of stars suitable for life (e.g. stable, long-lived, right size)
- H_p : the average number of planets in the habitable zone in each planetary system
- F_l : the fraction of habitable planets that can actually support life
- F_i : the fraction of habitable planets that can actually support life
- F_t : the fraction of habitable planets that can develop detectable technologies
- P_d : the possibility that we can detect the signals extraterrestrial beings send out to space

The final answer is obtained by:

- 1) starting with the total number of stars in the Milky Way
- 2) narrowing it down to the stars that could actually support life
- 3) obtaining the number of planets with life from [2]
- 4) narrowing it down to the planets that could actually support life
- 5) narrowing it down to the planets that could support intelligent life capable of developing detectable technology
- 6) narrowing down to the civilisations whose signals we could detect

Made by Dr. Frank Drake in 1961 

Interesting posters

WHAT IS THE COSMIC DISTANCE LADDER

How did the Ancient Astronomers manage to measure and estimate distances in the universe?

Thank you for setting a new question for AC2025

Thanks for the ad...

WHAT WE THOUGHT...

The sky is dark because the Sun sets!

"I never make the mistake thinking that the Sun rose because I woke up"

-David Neo, 2025

THE DRAKE EQUATION IS AN
EQUATION IS AN EQUATION

Equation must be so important that it was said three times...

Interesting posters...

Please check your spellings...

Mars may be the future,
but **Earth is the now.**
We need to clean up our
act **here**, before we mess
up **there** too.

BUT... Mars has issues

New drake equation:

$$N = S_n * F_s * H_p * F_l * F_i * F_t * P_d$$

Where:

- N the number of civilisations in the universe with which communication might be possible
- S_n the number of stars in the Milky Way
- F_s the fraction of stars suitable for life (e.g. stable, long-lived, right size)
- H_p the average number of planets in the habitable zone in each planetary system
- F_l the fraction of habitable planets that can actually support life
- F_i the fraction of habitable planets that can actually support life
- F_t the fraction of habitable planets that can develop detectable technologies.
- P_d the possibility that we can detect the signals extraterrestrial beings send out to space

The final answer is obtained by:

- of stars in the Milky Way
- 5) narrowing it down to the planets that could support intelligent life capable of developing detectable technology
- 6) narrowing down to the civilisations whose signals we could detect

Challenge: spot the difference

Interesting posters...

- As an object moves towards the observer, the wavelength shortens
 - Hence the light moves towards the infrared end, thus looking more red
 - This is called redshift
- If an object moves away from the observer, the wavelength increases
 - The light moves towards the ultraviolet end, thus looking more blue
 - This is called blueshift

Definitely redshifting from your grades

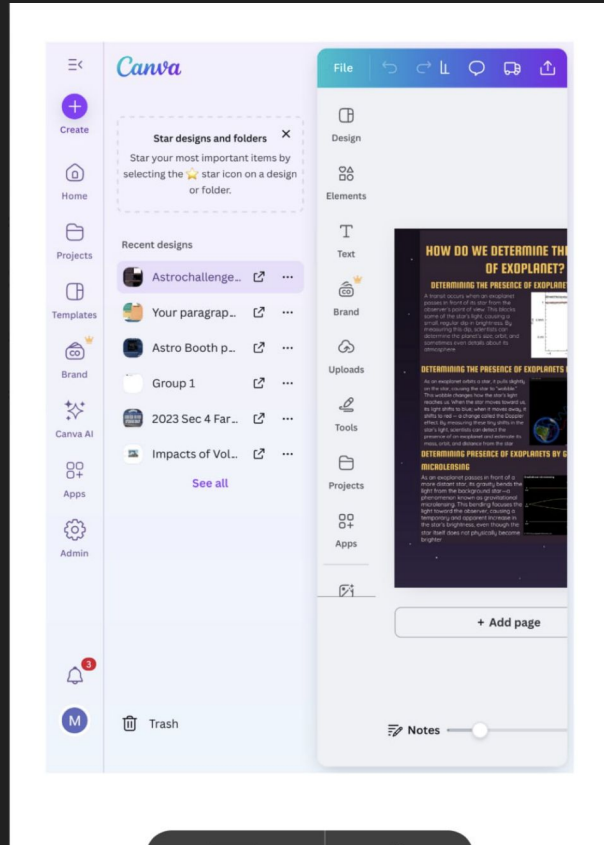

Is the start of starting material

Is the start of is the start of is the start of is the start of....

Key results

Most correct: Q19

19. On October 14 2024, NASA launched Europa Clipper, to investigate Europa and study the nature of its ice shell, the subsurface ocean, and the moon's geology. Why did NASA choose to study this moon of Jupiter?
- (A) Europa shows volcanic activity likely caused by tidal friction with Jupiter, which heats the interior of the moon. Hence, the need to learn the intricacies of this process.
 - (B) Europa has the largest body of water of any body of the solar system other than Earth, and hence may serve as an additional source of water for humans on earth.
 - (C) Europa has a subsurface ocean and may potentially host life. Hence the possibility of signs of life.
 - (D) Europa is found to have cryogeysers with traces of iron compounds and hence may turn into a red moon.
 - (E) Europa is one of the biggest moons in the solar system that still hasn't been explored.

Solution:

Europa has a subsurface ocean that may harbor conditions suitable for life, making it a prime target for astrobiological investigation.

Correct answer: C

Key results

Most correct: Q19

Most wrong: Q31

31. The star Manchun is 8×10^4 times more luminous than the Sun and 25 times more massive than the Sun. What type of star is Manchun most likely to be?

- ☐ (A) White dwarf
- ☐ (B) Red giant
- ☐ (C) Red supergiant
- ☐ (D) T-Tauri star
- ☒ (E) Main sequence

Solution:

Apply the mass-luminosity relation for main sequence stars:

$$L \propto M^{3.5} \Rightarrow L = 25^{3.5} \approx 8 \times 10^4$$

This matches the given luminosity, confirming it's a main sequence star.

Correct answer: E

Uranus the star

Telescopes were not as good as they are now, so people were not able to spot Uranus. Uranus is also a very dim star. Hence, people did not know about Uranus before 1781.

ing much like rivers on earth, creating

s a very massive planet, and with great mass, comes great sphere of influence.

UNCLE BEN?

The oldest rocks on Earth are estimated to be 4.5 billion years old, and we believe Earth is the same age. Explain why and how we can tell the age of the Earth just by 'looking at rocks'

2) f) "Looking at rocks" is a far oversimplification of ~~the~~ the matter. The age of rocks is determined via radioisotope dating, not merely scientists gaily doting about in their laboratories. To make such a grave oversimplification is shameful! Radioisotope dating is an incredibly pristine and delicate science, something a fool (such as yourself) could never do! Calling it "looking at rocks" would be akin to calling your question setting "banging a typewriter," which I must admit can't be far from the truth! By analysing the composition of the rock, determining the concentrations of varying isotopes such as Uranium 238 or Lead 207, we can determine via their half-lives the amount of time they have been embedded within the stone, a fate a fool like you ultimately deserves! Rather than aimlessly hitting a keyboard like a monkey in a thought experiment, why don't you perform your own research before calling it "looking at rocks"! - Yours Sincerely, A fed up geology major.

Chill bruh there wouldn't be a question if we said radiocarbon dating

Although the moon is around the same age as the Earth, its surface is very heavily cratered compared to Earth. Suggest 2 reasons why.

g) The moon, unlike the Earth, lacks ² things. An atmosphere, ~~and active tectonics~~, and water.

Firstly, the lack of an atmosphere prevents ~~very~~ meteoroids from burning up, allowing them to directly impact the moon to create a crater. Next, ~~the lack of~~ ~~active tectonics prevents them from subducting and being destroyed~~. Lastly, the lack of water prevents erosion from destroying the craters.

Mr geology major you missed plate tectonics

(c) What is the reference plane that we, the people on the space station, are using to determine the inclination of Earth?

[1]

c) The ~~so~~ surrounding plants

?????

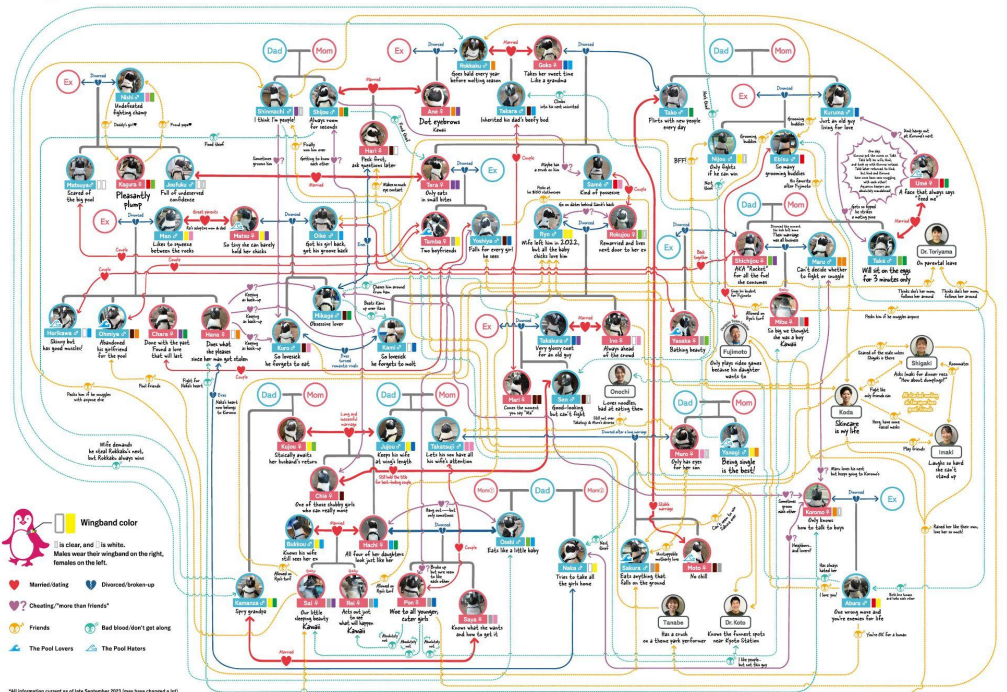

c) The ~~so~~ surrounding plants

Presentation of answer is important!

Every life has its own drama! Three minutes to figure it out, hours to take it all in!

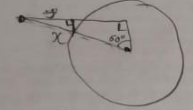

Kyoto Penguins Relationship Chart 2024

Make sure you actually understand the question!

$$l = 2 \sqrt{(6.963 \times 10^8 + 6.370 \times 10^6)^2 - (d \cos i)^2}$$

$$l = 2 \sqrt{4.760 \times 10^{17} - (d \cos i)^2}$$
 Assume inclination is 60°

\triangle 30-60-90 right triangle is formed

R_S : Diameter of sun = $2 \times R$
 $R = 285200000$
 $R = 16020370$
 $d = \frac{\text{radius of sun}}{\sin(60^\circ)}$
 $d = \frac{6.963 \times 10^8}{\sin(60^\circ)}$
 $d = 804017084.9$

$$l = 2 \sqrt{4.760 \times 10^{17} - (804017084.9 \times \cos 60^\circ)^2}$$

$$l = 1121407633$$

MUHAHAHAHA HA
 I DID IT 😊

3f) bruh why eqn so long

$$l = 2 \times \sqrt{[(6.963 \times 10^8) + (6.370 \times 10^6)]^2 - [(1.495978707 \times 10^8)(\cos 1)^\circ]}$$

$$= 1.405359787 \times 10^9$$

idk what to put so I put 1 wow!

- (f) Given that the radius of Earth and Sun are R_E and R_S respectively, the inclination of the Earth's orbit at any point of time is i , and the radius of the Earth's orbit is d , show that the apparent distance travelled by the Earth, l during each transit is given by Equation 9.

$$l = 2\sqrt{(R_S + R_E)^2 - (d \cos i)^2} \quad (9)$$

You are highly encouraged to use diagrams wherever possible to aid in your derivation and explanation. [2]

Yes! Y'all answered the question...just the wrong way

Instructions unclear..?

- (f) Given that the radius of Earth and Sun are R_E and R_S respectively, the inclination of the Earth's orbit at any point of time is i , and the radius of the Earth's orbit is d , show that the apparent distance travelled by the Earth, l during each transit is given by Equation 9.

$$l = 2\sqrt{(R_S + R_E)^2 - (d \cos i)^2} \quad (9)$$

You are highly encouraged to use diagrams wherever possible to aid in your derivation and explanation. [2]

Yes! Y'all...literally showed the equation??

When in doubt, just trust physics

(same team btw)

3j) The value of r , is ~~negative~~ so it is
in orbit positive

3h) Yes. Gravitational pull of the Sun and ~~Earth~~ are pulling
on each other, and like that is in physics.

Diagrams helps! (And sometimes doesn't)

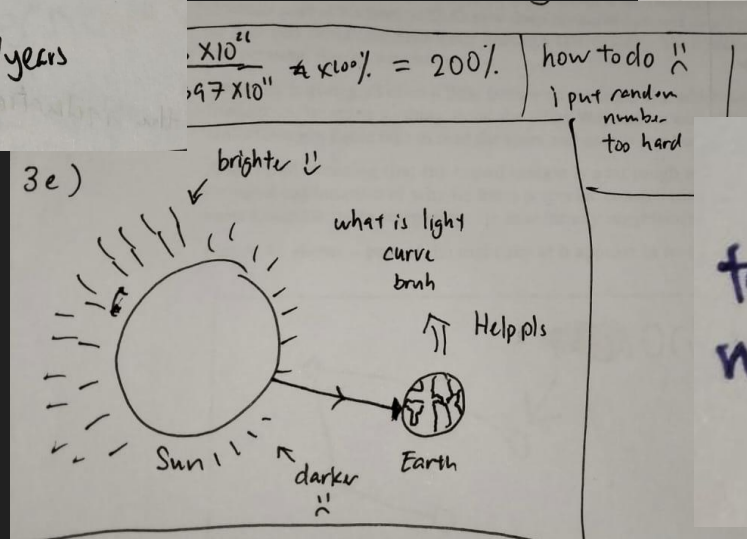

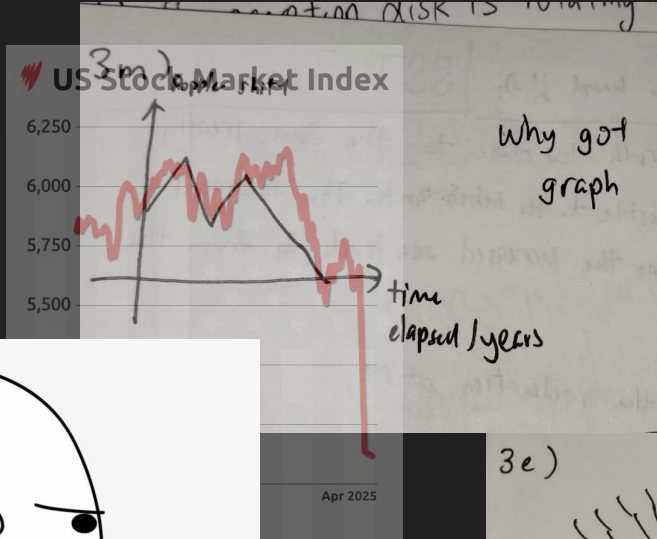

(surprisingly) good diagram

...but you should know what you are supposed to draw too...

Diagrams helps! (And sometimes doesn't)

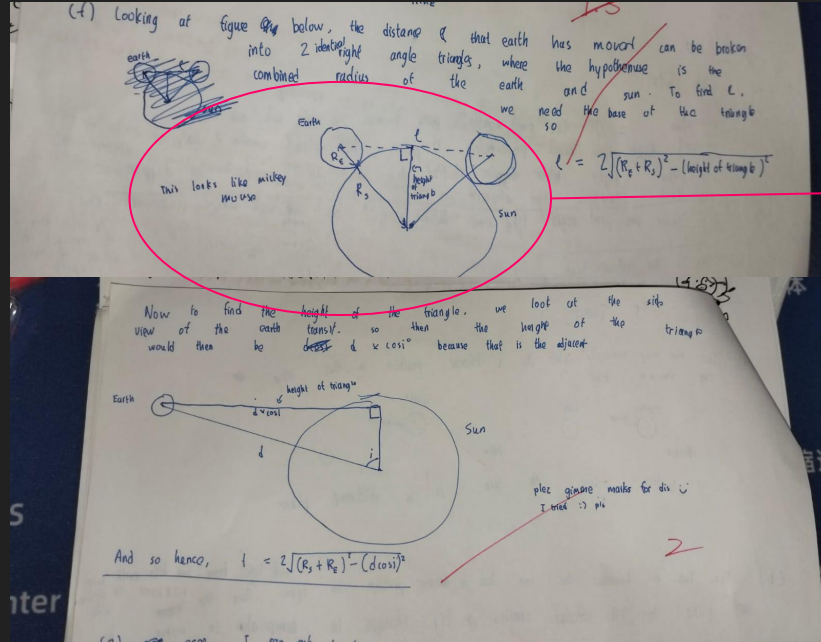

$$\frac{.X10^{26}}{.97 \times 10^{26}} \times 100\% = 200\%$$

how to do it
i put random number too hard

Diagrams helps! (And sometimes doesn't)

Most of the time the simplest explanations do the best!

(ngl I didn't think about that)

SasstroChallenge: Honesty is the best policy

(k) no.
(m) nub uh

how to do ^^
i put random
number
too hard

bro what are these questions

(d) idk
(e) idk

why u make so hard ^^

Shout out to this chad

(d) Calculate the maximum percentage change in the brightness of the Sun with respect to the spaceship when the Earth transits the Sun, if possible. State any assumptions made in your calculations, if any. [2]

(d) Trick question. my favourite food is the colour blue.

Mine's the very specific purple that a sunset has btw

Ayeyo hol' up, maybe honesty is not always the best policy

A thir- I mean love story wasn't in the AstroChallenge Committee's notebook

g) "hear me out --- that guy wearing white

(b) } O/c hear me out right like

Final Messages

p.s.
what is the meaning of life?

teammate's incoherent ramblings pls ty.
he has skill but used it wrongly

Sounds like skill issue

Question 4: El Primo

◆ AI Overview

El Primo is a rare brawler in Brawl Stars. He is a tank-type character with a short-range melee attack and a Super that allows him to jump and land on enemies, dealing damage. His abilities make him effective at close combat and disrupting enemy formations. [🔗](#)

Here's a more detailed look at El Primo's abilities and how he's used in Brawl Stars:

Main Attack:

El Primo throws punches that deal damage to enemies within a short range. [🔗](#)

Super:

Star Map

- Was always going to be a “either you know or don’t question”
- Less than half the teams got any points here
- As evidenced by the beautiful maps they drew
- No less than 5 teams circled Vega and Capella as the answer to the DSO question (part c)

4d) He is a bad photolator, I am better 
4e) It refracts but does not reflect. 
- Sun Tzu

"I did not say that"
- Sun Tzu, Art of War

diurnal motion is the movement of celestial
objects during the day  

My fellow geography students

(d) The ~~light~~ sound frequency they captured it in
is wrong

I...what?

Sidereal Time and Figure 18

This figure is supposed to help you visualise the difference between a solar day and a sidereal day.

Which will allow you to answer Qn 4(m).

Figure 18: Comparison between sidereal time and solar time [5]

What I expected

(m) Based on Figure 18, do stars rise earlier, later or at the same time every day? Explain your answer.

[2]

Solution:

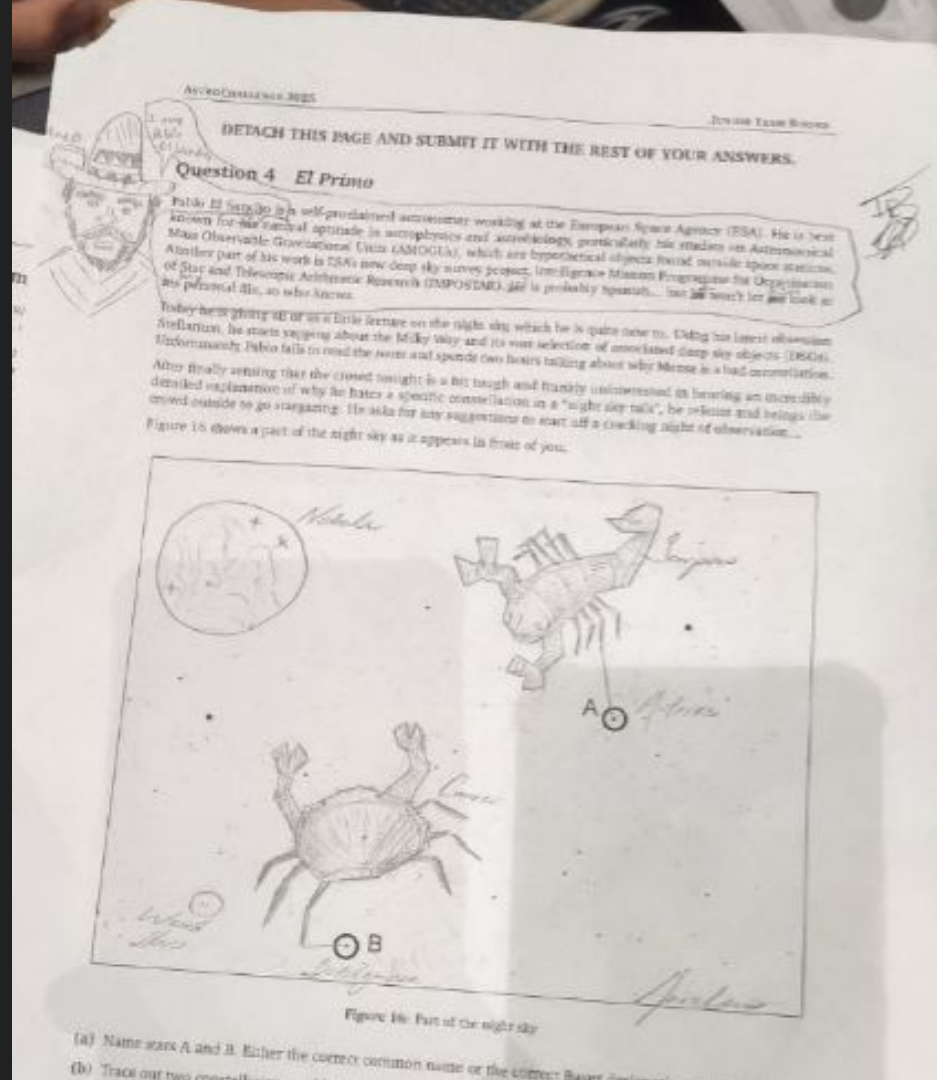

Earlier. A star that is currently rising will be at the same position 23 hours 56 minutes and 4 seconds later. That is, about 4 minutes earlier on the clock of the second day.

To some teams' credit, this question was answered pretty well.

What I got

m. Earlier. As Earth orbits the sun, the earth will be nearer to the distant star with every rotation and as such, making the star rise earlier every day.

Key results

Most correct: Q14

SKA - Low is a radio telescope being built in Western Australia and is set to be the biggest radio telescope in the world when it is completed in 2028. It uses 131,072 log-periodic antennas spread between 512 stations at a length around 75km. The antennas are arranged in an interesting shape as shown in Figure 3.

Figure 3: Questions 14 to 15. [5]

14. Which of the following best explains why the antennas are in a Christmas tree shape?

- (A) Antennas are stacked vertically on top of each other to filter out unnecessary wavelengths of light for higher sensitivity.
- (B) Antennas of different lengths are able to capture different frequencies - longer antennas for lower frequencies and shorter antennas for higher frequencies. This allows scientists to study the universe in a range of frequencies.
- (C) Some antennae are used for communication between 'trees' while only some are used in observing the night sky.
- (D) The Christmas tree shape provides the best structural stability against weather conditions such as sandstorms and rain.
- (E) The engineers who designed SKA - Low proposed their plan on Christmas day.

Key results

Most correct: Q14

Most wrong: Q11, Q32

11. In 1588, Tycho Brahe published the Tychonic system, which is a geoheliocentric model in which the Sun, the Moon and stars revolve around the Earth, and other five planets (Uranus and Neptune were not yet discovered) revolve around the sun.

Back when it was proposed, it was a major competitor, along with the Copernican heliocentric model, as an alternative to the Ptolemy's geocentric model.

However, the scientific community eventually replaced the Tychonic model with the Copernican model. Which one of the following observations could have contributed to the support for Copernicus' heliocentric model **over the Tychonic model**?

- (A) The observed seasonal change of the declination of the Sun on the celestial sphere.
- (B) The observation of the retrograde motion of Mars.
- (C) The observation of the phases of Venus in 1610.
- (D) **The observation of stellar parallax of 61 Cygni in 1838.**
- (E) All of the above.

Solution:

While all observations are true, only D demonstrated a clear reason why the Copernicus heliocentric model should be chosen in favour of the Tychonic geoheliocentric model.

The Tychonic model explains observations A, B and C perfectly well.

Observation A could be modelled by geocentric (and geoheliocentric) models as the Sun moving along the ecliptic on the celestial sphere. In fact, this view is some time still used for convenience today, especially in practical astronomy.

As the Tychonic model involves the planets orbiting the Sun, which in turn, orbits the Earth, it explains why there would be Venus phases (Observation B) and retrograde motion (Observation C) perfectly well.

Since the Tychonic model proposes that Earth is the centre of the universe, there should not be any stellar parallax. After stellar parallax was observed (D), it seems that Copernicus' heliocentric model, which could explain stellar parallax, seemed to be a better model.

Correct answer: D

Key results

Most correct: Q14

Most wrong: Q11, Q32

32. Figure 7 is a graph of the frequency of sunspots seen against time. which of the following observable quantities will reach a maximum during a sunspot minimum (e.g. in 2010, circled below)?

Figure 7: Question 32. [1]

- ☐ A Galactic Cosmic Ray Flux
- ☐ B Solar irradiance
- ☐ C Coronal Mass Ejections
- ☐ D Solar eclipses
- ☐ E Solar radio flux

Solution:

The circled point corresponds to solar minimum. At this time, the Galactic Cosmic Ray Flux is highest due to reduced solar magnetic activity and shielding.

Correct answer: A

DRQ

Question 1: Astrophotography

Question 1

Meant to be short-answered question.

Teams generally kept the answer short. Thanks for saving my sanity.

Generally well-done

Rarely in AC do you see this kind of mark distribution...

General comments

Generally well done.

Different parts requires different approach:

- Trivia / Experience
- Background knowledge in photography
- Source reading and analysis

The easiest part is not always at the front.

The preambles provide a surprising amount of information!

Consulting the guide further, he learnt that the images that he takes of the desired field of view are called “light frames”. In addition, the same guide highly recommends him to take a bias frame, a dark frame and a flat frame. The techniques as recommended by the book is as stated below:

	Bias Frame	Dark Frame	Flat Frame
Exposure Time	Shortest possible	Same as light frame	Appropriate time such that the signal is of the proper exposure ¹ , based on the image histogram
Gain (ISO setting)	Same as light frame	Same as light frame	Same as light frame
Ambient temperature	Same as light frame	Same as light frame	Does not matter
Filters	Does not matter	Does not matter	Same as how light frames are taken
Special Pointers	Take with lens cap on (no light signal)	Take with lens cap on (no light signal)	Take with a uniform light source Take at the same camera angle as light frame
Corrects for			

Table 1: Techniques as recommended by the astrophotography guide [10]

(f) Fill up the last row of table 1 with the following keywords:

Dark signal non-uniformity	Difference in gain of each pixel	Noise generated from electronics	[3]
----------------------------	----------------------------------	----------------------------------	-----

Answer on blank paper. State clearly which column you are putting each keyword under.
For example: “Bias frame: Dark signal non-uniformity”.

Part IV A Surprising Find

Suddenly, Wertz was informed that his club’s equipment IC has already taken a set of bias frames, dark frames and flat frames for a previous astrophotography session, one month ago. He was also in Singapore, using the same camera and telescope.

Investigating further, Wertz has found that the gain (ISO setting) from the previous session has been consistent with the light frames he has taken today. However, the exposure time of each light frame is different, and that the orientation of the set-up (e.g. orientation of the camera with respect to the telescope) is different as well.

- (g) Can bias frame be reused? Why or why not? [2]
- (h) Can dark frame be reused? Why or why not? [2]
- (j) Can flat frame be reused? Why or why not? [2]

¹“proper exposure” here refers to a suitable length of exposure such that the histogram of the picture, which indicate the distribution of pixels with certain brightness, peaks around the middle. In addition, close to all (ideally all) pixels should not be too bright (overexposed) or too dark (underexposed).

Some interesting answers...

It is a rare clear night in Singapore and Wertz intends to use his school's astronomy club equipment to do deep sky photography. His school has a climate-controlled room that stores all of the club's equipment.

- (a) Upon taking out the telescope from the climate-controlled room to the hot and humid observation site, he should start his observation as soon as possible to make full use of the clear night. Is this true or false? Elaborate and explain your answer.

[2]

??
a) False. He should give the telescope some cool-down time. The change in environment especially to a hotter and more humid weather means certain convection cycles can be set up in the telescope and so there should be time given to allow the telescope set-up to be acclimatised to its new surroundings. ~~the new temp.~~ convection cycles of any movement of air reduces turbulence.

??

NO. Because

Some REALLY interesting answers...

pack it up unc   

Don't give up!

Wertz: Bayer Leverkusen \rightarrow Liverpool

f: $G \rightarrow H$

Wertz more like

Wurst \rightarrow sausages in deutsche.

Q2 Fuzzy Moments

Question Setting Philosophy

- Test concepts and physical understanding rather than algebra and calculus

“Math is not Physics. You cannot math your way out of the physics.”

- *Sun Tzu, Art of War (probably)*

- Focus on galaxies & observational astronomy

How did everyone perform?

- Very Badly

- Mean: 3.1935

- Median: 0

- Mode: 0

- High: 15

- Low: 0

What went wrong???

My guess: teams have a huge blind spot in what they read up on

- Q2 demanded a decent grasp of certain fundamentals:
 - Various spectroscopic techniques and what they can be used for
 - Have some picture of how stars move within galaxies (both spiral & elliptical)
 - Be aware that there are such things as galaxy clusters and the intra-cluster medium (ICM)
- Many teams seem to have *very minimal* awareness of the above!
- Difficult questions expect you to make further inferences given the text & your existing knowledge
 - E.g. you are not expected to know what galactic quenching is; there are explanations in the footnotes!

Some examples of
what I thought were
giveaway questions
but were not giveaway
questions after all

(a) Suggest a method for observationally measuring the velocity dispersion σ of an elliptical galaxy.

[1]

Hint: Consider how spectroscopy can be used to measure velocity.

Answers fell into 5 cases:

- C1: Explains how the motion of stars causes doppler broadening
- C2: Measure doppler shift throughout galaxy and compute standard deviation
- C3: Measure doppler shift+ no elaboration (clearly regurgitating the hint)
- C4: 'Creative' answers
- C5: Blank

C5 was the plurality of answers

my mood while
marking

9
On different nights, take photos of the galaxy and look for changes between photos, which will correspond to the velocity dispersion σ of an elliptical galaxy. *wow.*

Waiting for the stars
to move in M87

spectroscopy, obtain a star's spectrum through its characteristic lines
 for the star on a H-R diagram to obtain and find its absolute magnitude
 measure apparent magnitude using $m - M = 5 \log(d) - 5$
 then which apply the formula $\frac{L_1}{L_2} = 10^{(M_2 - M_1)/2.5}$ Huh
 to find L , since $L = K V^\alpha$

$$\frac{L_1}{L_2} = \frac{V_1^\alpha}{V_2^\alpha} = 10^{(M_2 - M_1)/2.5}$$
, rearrange to find V .

$$2 \langle KE \rangle + \langle GPE \rangle = 0$$

$$\langle GPE \rangle = -2 \langle KE \rangle$$

We want to measure dispersion σ
 in order to find the absolute
 magnitude M , not the other way
 round!!!

The curious case of C2

Your logic:

- Velocity dispersion is a standard deviation
- Measure the recessional velocity across the 'face' of the galaxy and compute the sample standard deviation

The good:

- You guys are reading the text

The questionable:

- Are you sure that all the stars in your line of sight have a similar velocity?

Hint: How do stars move in an elliptical galaxy? How is it different from a spiral galaxy?

$$2\langle KE \rangle + \langle GPE \rangle = 0$$

(b) Show that the average total energy of a system obeying Equation 3 is negative, and explain the physical implication.

[1]

Expectation

- 1) Recall the definition of total energy
- 2) Substitute into Virial Theorem equation

b) $\text{KE Total energy} = \langle KE \rangle + \langle GPE \rangle$

$$\langle KE \rangle + \langle KE \rangle + \cancel{\langle GPE \rangle} = 0$$
$$\langle KE \rangle + \cancel{\langle GPE \rangle} = - \langle KE \rangle$$

simple as. $\langle 0 \text{ (shown)} \rangle$

Reality

$$(b) KE = \frac{1}{2}mv^2$$

$$U = -\frac{GMm}{R}$$

why

$$F = m \frac{v^2}{R} = \frac{GMm}{R^2}$$

$$\Rightarrow mv^2 = \frac{GMm}{R}$$

this is for a Kepler orbit

$$KE = \frac{1}{2}mv^2 = \frac{GMm}{2R}$$

$$\Rightarrow TE = KE + U = -\frac{GMm}{R}$$

which is

$$2) 2\langle KE \rangle + \langle GPE \rangle = 0$$

$$2\langle \frac{1}{2}mv^2 \rangle + \langle -\frac{GMm}{r} \rangle = 0$$

$$\boxed{mv^2 - \frac{GMm}{r} = 0}$$

$$m(rv)^2 - \frac{GMm}{r}$$

$$mr^2\omega^2 - \frac{GMm}{r} = 0$$

??

$$\omega^2 - \frac{GM}{r^3} = 0$$

its like always $\omega^2 = 0$

$$\text{since } GPE = -\frac{GMm}{r}$$

HEL

$$Ep = -\frac{Gm_1m_2}{r}$$

$$Ek = \frac{Gm_1m_2}{2r}$$

this assumes orbit

$$2\left(\frac{Gm_1m_2}{2r}\right) - \frac{Gm_1m_2}{r} = 0$$

you need to conserve angular

b) Assume ellipse can be neglected

$$-\frac{3}{5}\frac{GM^2}{R} + 2\left(\frac{1}{2}Mv^2\right)$$

$$= -\frac{3}{5}\frac{GM^2}{R} + Mv^2$$

$$= M\left(-\frac{3GM}{5R} + v^2\right)$$

$$2\langle KE \rangle + \langle GPE \rangle = mv^2 - \frac{GMm}{R}$$

$$= \frac{GMm}{R} - \frac{GMm}{R}$$

$$= 0$$

Assume circular
 $\frac{mv^2}{R} = \frac{GMm}{R^2}$
 $mv^2 = \frac{GMm}{R}$
veduno

$$\therefore \langle KE \rangle + \langle GPE \rangle = \frac{1}{2}\frac{GMm}{R} - \frac{GMm}{R}$$

link to virial theorem!

$$= -\frac{1}{2}\frac{GMm}{R}$$

total energy since M, m

what the sigmaaaa

Not only you are shooting your own foot by overcomplicating things, your argument is also incorrect fundamentally!

$$2\langle KE \rangle + \langle GPE \rangle = 0$$

This little equation is
fully general and applies
to all
gravitationally-bound
many-body systems!

(j) What are some other likely differences between 'red sequence' and 'blue cloud' galaxies? State two reasons. [2]

IVj) Red sequence \rightarrow Red shift
Blue cloud \rightarrow Blue shift
huh.

$$\left(\frac{M}{L}\right)^{-2}$$

⌘ (j) one is spiral and one is lenticular. Thank you captain obvious
The spiral galaxy is older than the lenticular.

Just rehash your answers for spirals vs ellipticals!

- No active star formation
- Stars are older and thus redder
- No cold gas reserves

- Active star formation
- Stars are younger and thus bluer
- Have cold gas reserves

Do AC teams know what a lenticular galaxy is?

lenticular galaxies are formed by spiral and elliptical galaxies colliding. The ~~and~~ rotational direction of the galaxies

Is the Hubble tuning tree?

Did early-type galaxies form 'earlier'?

Heavily symmetric top precession (trust me lol)
The number of stars. early galaxies have less stars than late galaxies as they have more time to develop ~~no!~~

One is spiral
The spiral galaxy is older than the lenticular.

c) All the info is given to you; just piece it together

We can write a familiar-looking expression for rotational kinetic energy $\langle KE \rangle = \frac{1}{2} M \langle v^2 \rangle$ assuming identical masses of individual stars³. But beware! v here should be thought of as a probability distribution describing the individual rotational velocities of individual stars in the overall population, and the angled brackets $\langle \rangle$ ⁴ represents an averaging operation. M here refers to the total mass of the entire system, and $\langle v^2 \rangle$ is actually the mean-square velocities of all particles in the system. This is a quantity called the second (statistical) moment $E[v^2]$, which can be related to the more familiar variance $\text{Var}(v)$ by the following formula:

$$\text{Var}(X) = E[X^2] - E[X]^2 \quad (4)$$

As for the gravitational binding energy term, we let $GPE = -\frac{GM^2}{R}$, where M again is the total mass, G is the gravitational constant, and R is the radii of the system.

(c) Show that:

$$V^2 + \sigma^2 = \frac{GM}{R} \quad (5)$$

where V is the rotational velocity and σ is the velocity dispersion. State any other assumptions made. Hint: Think carefully about the physical meaning of the terms, and do not expect to arrive at the answer by only algebraic substitutions.

[2]

Just explain to me why velocity dispersion is $\sqrt{\text{Var}(v)}$ and rotation speed is $E[V]$

In fact, I gave you the explanation for this in the text!

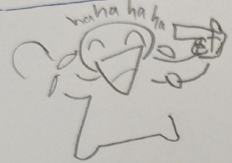

Underlying lesson: KE of a many-body system can be separated into rotation and dispersion contributions!

Model answer for c)

- Neat presentation
- Clearly explained line of reasoning
- No 'magic' and handwaving

across space, it loses energy the core of universe.

no ha ha ha

(c) Using Virial Theorem,

$$2\langle KE \rangle + \langle GPE \rangle = 0$$
$$2 \times \frac{1}{2} M \langle v^2 \rangle + \left(-\frac{GM^2}{R} \right) = 0$$
$$M \langle v^2 \rangle = \frac{GM^2}{R}$$
$$\langle v^2 \rangle = \frac{GM}{R} \quad \text{--- (1)}$$

Since $\text{Var}(v) = E[v^2] - E[v]^2$,
with $E[v^2]$ being $\langle v^2 \rangle$,

and since σ refers to velocity dispersion which is sort of a 'standard deviation' of rotational velocities, then you could assume that $\text{Var}(v)$ would be σ^2 .
Lastly, assuming V is the mean rotational velocity of all the stars in the galaxy, then $E(v)^2$ would give V^2 .

This would give ~~$V^2 = \sigma^2 + V^2$~~ $\sigma^2 = \langle v^2 \rangle - V^2$

$$\langle v^2 \rangle = V^2 + \sigma^2 \quad \text{--- (2)}$$

Sub (2) into (1),

$$V^2 + \sigma^2 = \frac{GM}{R} \quad \text{--- (shown)}$$

impressive.

(c) 2

What is the point of the question?

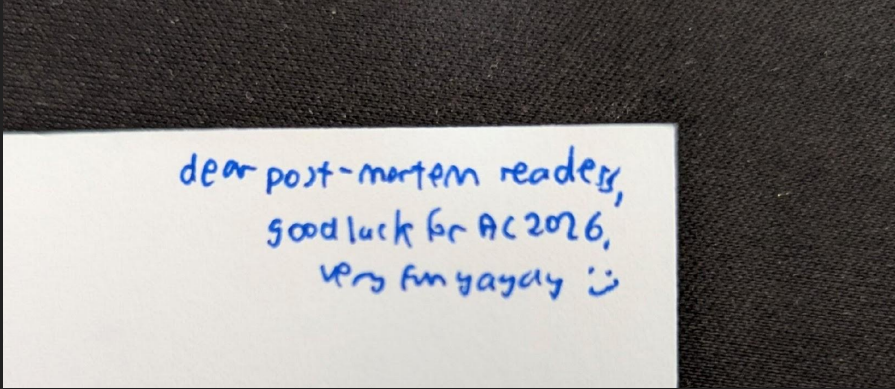

The 'story' I was hoping to tell:

1. We think of (and model) spirals vs. ellipticals as rotation vs. dispersion-dominated systems
2. These kinds of models oversimplify the diversity of ellipticals (more generally early-type galaxies)
3. There are such things as fast-rotating and slow-rotating ETGs; slow rotators are more massive than fast rotators
4. Our current best theory for this dichotomy is the hierarchical merger of galaxy clusters

I don't expect you guys to understand every little detail; just the broad outline of the argument!

Lastly, a message from one of your peers with
Stockholm syndrome

dear post-mortem readers,
good luck for AC2026,
very funny day :)

Question 3: The Sound Game

How did the question go?

Generally VERY WELL DONE! YAY.

Mean: 8.532258065

Median: 8.5

Mode: 9

Highest: 18.5

Lowest: 1

Reminds me of NYC skyline but ok

But before the good stuff...

But before the good stuff...

positive charge's
photons, and elect

Electromagnetic repulsion between ~~the~~ ~~po~~ the nuclei
and the photons, due to like charges leading to

PHOTONS. ARE. NOT. POSITIVE

After the crashout, question by question breakdown:

Subpart (a)

(a) Why does sound not travel in space? Answer strictly in one sentence.

**If anyone of you got it
wrong, I would've
emailed your school's
physics department to
request an explanation.**

After the crashout, question by question breakdown:

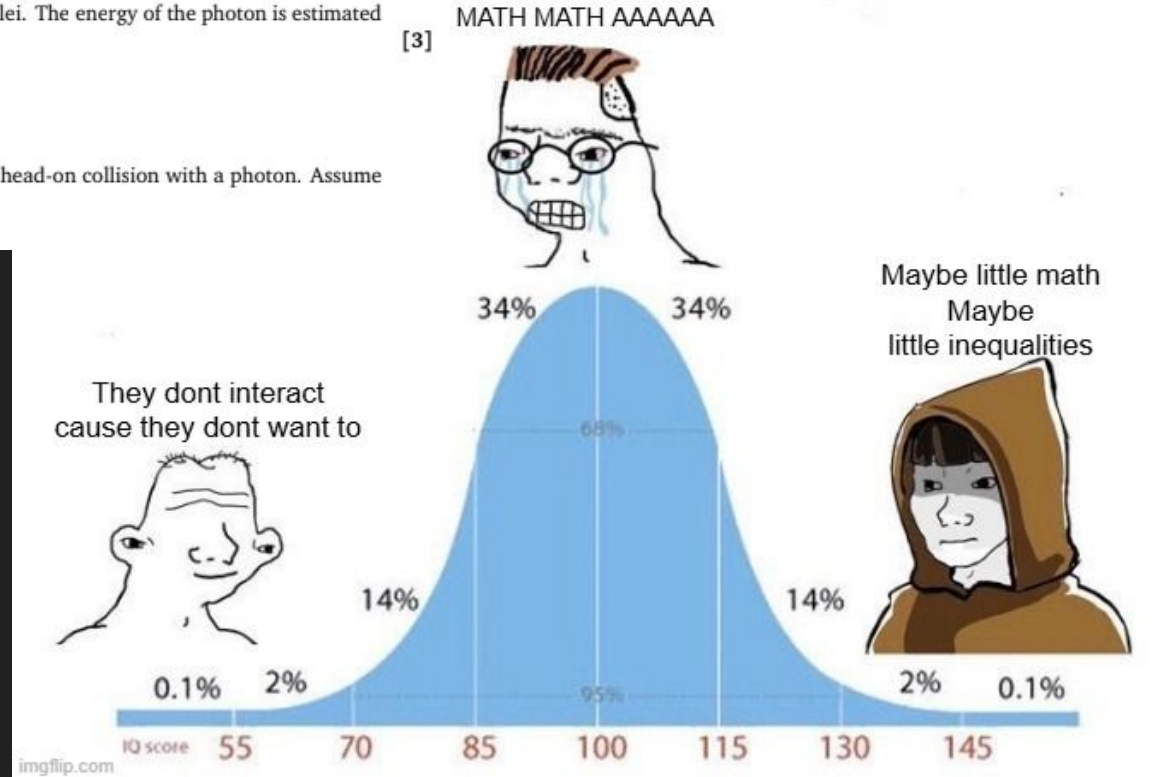

Subject (b)

(b) Explain why the photons did not interact significantly with the nuclei. The energy of the photon is estimated by $E = k_B T$ where k_B is the Boltzmann constant.

Hints:

1. Use a conservation law.
2. Consider the particles as classical balls.
3. Calculate the final speed of an electron and nuclei after their head-on collision with a photon. Assume the photon transfers all its energy to the other particle.
4. Think about the correct use of $E^2 = p^2 c^2 + m^2 c^4$.

You all need to calm down
and read it properly

After the crashout, question by question breakdown:

Subpart (b)

I expected:

1. Conservation of linear momentum
- or
2. Conservation of energy [MUST BE CAREFUL]

A good example without calculations...

For a photon, rest mass = 0 $\Rightarrow E^2 = p^2 c^2 \Rightarrow p = E/c = \frac{k_B T}{c}$

For an electron-photon collision, assuming all energy transferred from photon

$e^- \quad \text{photon}$
 $\leftarrow \quad \rightarrow$

$\Sigma p_i = \Sigma p_f$
Initial electron $-\frac{h\nu}{c} = \text{final electron} = \frac{k_B T}{c} = \text{final photon} \Rightarrow \Delta p_{\text{electron}} = \frac{k_B T}{c}, \Delta v_{\text{electron}} = \frac{k_B T}{m_{\text{electron}} c}$

whereas ~~by far~~ for nuclei-photon collision

(gone as e^- -photon)
Initial $p_{\text{nucleus}} - \frac{k_B T}{c} = \text{final } p_{\text{nucleus}} \Rightarrow \Delta p_{\text{nucleus}} = \frac{k_B T}{c}, \Delta v = \frac{k_B T}{m_{\text{nuc}} c}$. Since, $m_{\text{nuc}} \gg m_{\text{electron}}, \Delta v_{\text{nucleus}} \ll \Delta v_{\text{electron}}$

Nice! 3

After the crashout, question by question breakdown:

Subpart (b) However, what is this blasphemy

By Conservation Law, Since energy is a universal constant, ^(positive charge) photons and ^(negative charge) electrons would collide to be neutral while small nuclei is also neutral, to become stable.

Free photons cannot interact with photon significantly ~~for~~

(pair creation)

(neutral) nuclei

1) Interpretation: \oplus = addition, \otimes = multiplication
 2) Associativity: $(a \oplus b) \oplus c = a \oplus (b \oplus c)$
 3) Commutativity: $a \oplus b = b \oplus a$
 4) Distributivity: $a \otimes (b \oplus c) = (a \otimes b) \oplus (a \otimes c)$
 5) Identity: $a \oplus 0 = a$ and $a \otimes 1 = a$
 6) Inverses: $a \oplus (-a) = 0$ and $a \otimes a^{-1} = 1$
 7) Non-zero divisors: $a \otimes b = 0 \Rightarrow a = 0$ or $b = 0$
 8) Zero divisors: $a \otimes b = 0$ but $a \neq 0$ and $b \neq 0$
 9) Units: $a \otimes b = 1$ but $a \neq 1$ and $b \neq 1$
 10) Idempotents: $a \oplus a = a$ and $a \otimes a = a$
 11) Nilpotents: $a \otimes a = 0$ but $a \neq 0$
 12) Zero divisors: $a \otimes b = 0$ but $a \neq 0$ and $b \neq 0$
 13) Units: $a \otimes b = 1$ but $a \neq 1$ and $b \neq 1$
 14) Idempotents: $a \oplus a = a$ and $a \otimes a = a$
 15) Nilpotents: $a \otimes a = 0$ but $a \neq 0$
 16) Zero divisors: $a \otimes b = 0$ but $a \neq 0$ and $b \neq 0$

How does sound work?

(f) Explain how does an acoustic wave form inside the baryon-photon fluid with reference to compressions and rarefactions. Use sound as analogy if required

[2]

My mood after looking at good answer!

After the crashout, question by question breakdown:

Subpart (g) and (j)

Mathematical manipulation

(g) Explain what happens to the speed of the acoustic wave at recombination using the formula above. [2]

Hint: The mathematical tool of limits might be helpful here, but non-mathematical arguments are fine as well. Do NOT overthink.

Solution:

At recombination, the radiation is freely able to move in the universe. This means, suddenly,

$$\rho_r \ll \rho_b$$

Page 22 of 41

ASTROCHALLENGE 2025

SENIOR TEAM ROUND

Algebraically manipulating the equation, we notice,

$$c_s = \frac{c}{\sqrt{3}} \left(\frac{1}{1 + \frac{3\rho_b}{4\rho_r}} \right)^{\frac{1}{2}}$$

As $\rho_r \ll \rho_b$,

$$\frac{\rho_b}{\rho_r} \gg 1 \Rightarrow \frac{1}{1 + \frac{3\rho_b}{4\rho_r}} \approx 0 \Rightarrow c_s \approx 0 \text{ m s}^{-1}$$

This implies that the wave stopped immediately at recombination.

(j) What is the inaccuracy here? [1]

Hint: Refer to part (g) for hint. I must admit this is more of a mathematical question than a physical one, however we all must respect mathematics, nonetheless.

Solution:

The speed of sound in Cornelius' expression is assumed to be constant. However, from part (g), we know that the speed of sound was decreasing as time passed on due to changing densities. Therefore, c_s must be inside the integral sign in the expression, i.e.,

$$l_r = \int_0^{t_r} c_s(t) \chi(t) dt$$

Another happy question moment. Most of you understood this. but...

I wanted a plate...

Wondering if I can get the "plates" for an astronomy event in Singapore

Wed 12/18/2024 2:27 AM

Greetings of the day,

I am Kush, a Y2 Physics undergraduate and, the President of the National University of Singapore's Astronomical Society (NUSAS). NUSAS (along with our counterpart, NTU Astronomical Society) organises [AstroChallenge](#) every year — an astronomy event for pre-university students. 2025 marks its 21st iteration, and I would like to do something funny.

For the upcoming AstroChallenge, I am creating a question on Baryonic Acoustic Oscillations. During my research, I came across Dr Daniel Eisenstein's [lecture](#) at Harvard a decade ago on the same topic. During the lecture, he passed around the plates in which the fibers are connected for data collection. He mentioned how each plate was used once and then stored, probably for no further use.

I would like to ask if it's possible to get any one of those plates, from any SDSS survey, parceled to Singapore.

I understand it is a rather unusual request asking for a 10-pound aluminum plate parceled around half the globe, but it would make for an amazing story! Storied and experiences are extremely inspiring.

I was a participant in AstroChallenge from 2019-2022, and it was the reason why I choose astrophysics as my career path. For its 21st edition, I want to give back to my juniors and provide them this weird, but rather remarkable piece of aluminum to have a look at (and also significant to the question I am creating).

AstroChallenge 2025 takes place from 6th to 11th of June, 2025.

Any form of help with this *creative endeavor* would be greatly appreciated.

Thanks and regards,

Kushagra Shrivastava (FRAS)

President, 27th NUSAS Executive Committee

They AGREED???

Dear Kushagra,
I'm [redacted], the Education and Public Outreach Coordinator for SDSS-V. We should be able to ship a [redacted] plate to you. For universities we typically ask the university to pay for and arrange a shipping label. You then send it to the University of Washington where some of the [redacted] plates are stored and they ship the [redacted] plate to you. Would your institution be able to arrange and pay for shipping?

Thanks

[redacted]

But they wanted money 🥲🥲🥲🥲🥲🥲🥲🥲🥲🥲

I begged AstroChallenge got no money

Hi [REDACTED]

Thank you for the reply. [REDACTED] is an independent student-run organization, and we do not receive any funding from [REDACTED] directly.

Thus, is there any chance you could sponsor the shipping as well?

HORRAY THEY AGREED FOR COMPLETELY FREE

Dear Kushagra,

I'm pleased to tell you that our director has approved paying for the shipment of the **plate**. This is on condition that you only use the **plate** for education and outreach & don't sell it. Also that you send us lots of pictures of the event so we can publicise it on our social media. I've been asked by [REDACTED] (in cc) to ask you for the following information. Note that the postal code and phone number here are placeholders and you will need to replace them.

Thanks

I was so happy omgomgomgomgomgomgomg

Me fr

Then that trump happened...

The [Sloan Digital Sky Survey \(SDSS\)](#) has been funded by a combination of private and public sources, including the Alfred P. Sloan Foundation, the participating institutions, the National Science Foundation, the U.S. Department of Energy, the National Aeronautics and Space Administration, the Japanese Monbukagakusho, the Max Planck Society, and the Higher Education Funding Council for England,. SDSS-IV, for example, also received support from the Sloan Foundation, participating institutions, and national funding agencies. 

My follow up emails were never replied :(...
at least i tried

Just checking if there's any update on this?

Thanks and regards,
Kushagra Shrivastava

g) say it with me: when you speller fusion,
u get more stars! w stellar fusion!

Question 4

Generally went... as expected

Aim of the question

- 2 Pronged
- 1: Get a better understanding of the calculations and the physics behind orbital mechanics, especially hohmann transfers
- 2: Better understand the physics of moons and satellites and effects caused by tidal forces.

What actually happened

- Most attempted (a), (b), (c) and (d) and got it partially right
- (e) was attempted by many but....
- (f) and surprisingly (g) were left completely blank by most
- The rest of the subparts had varying degrees of attempts but very few teams got any correct
- No team got (m) or (n) correct

Parts (a) to (e): generally well done

part I taking H3 physics, still can't do this qn (not provided)

b) ~~at perigee~~ periastris.

~~at periastris:~~
 ~~$v_p = r_p \omega$~~

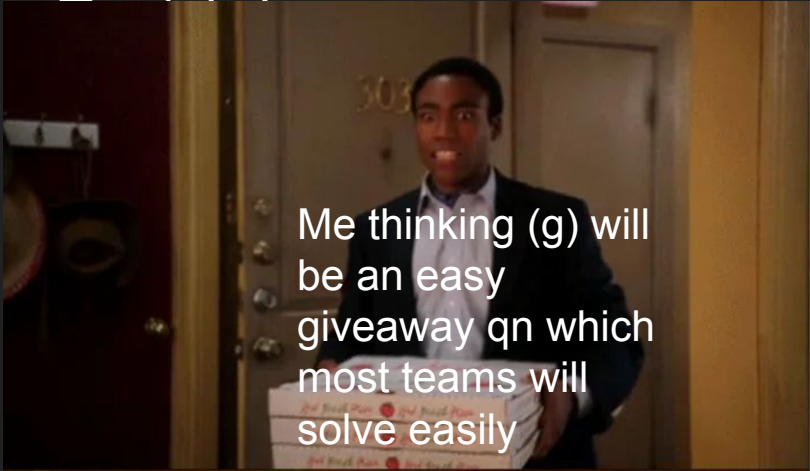

By COAM,

$$\frac{1}{2} v_a^2 - \frac{1}{2} v_p^2 = GM \left(\frac{1}{r_a} - \frac{1}{r_p} \right)$$

$$v_a r_a = v_p r_p$$

$$v_p^2 = v_a^2 \left(\frac{r_a}{r_p} \right)^2$$

A still from the TV show 'The Big Bang Theory' featuring the character Stephan. He is standing in a doorway, looking surprised, and holding a stack of boxes.

Me thinking (g) will
be an easy
giveaway on which
most teams will
solve easily

A still from 'The Big Bang Theory' showing a chaotic scene in a room. There is a fire on the floor, people running, and a man in a suit standing in the background.

One team trying to use
stephan-boltzman eqn
to derive Power is
directly proportional to
radius

Most teams
thinking this is
some advanced
magnitude on
and leaving it
blank or trying
to use
logarithms

on based on H2 Physics

Parts (f) , (m) and (n)

Only 1 team got (f) correct, none got (m) and (n) correct

f) Incorrect, the unit AU is not specified, 40AU could be more or less than $5.64 \times 10^3 \text{ m s}^{-1}$.

Nothing else to show here because everything else was blank

How to do (m): No one knew how to even start

Heating and volcanic activity on Io from tidal stretching

closest to
Jupiter, largest
tidal bulge

$$F_{\text{tidal}} = F_{\text{near}} - F_{\text{far}}$$

$$F_{\text{tidal}} = \frac{2GM_{\text{Earth}}md}{r^3}$$

F = total tidal force

G = Gravitational constant

M_{Earth} = mass of Earth in kilograms

m = mass of affected object on Moon

d = distance between objects

r = radius of Moon

farthest from
Jupiter, smaller
tidal bulge

(not to scale)

Work Done

Work done is the amount of energy transferred.

Work done = force x distance moved in the direction of the force.

$$W = \Delta E$$

$$W = F \times d$$

W = work done (J)

ΔE = energy transferred (J)

F = force (N)

d = distance moved in the direction of the force (m)

PART (n) WHY DOES NO ONE KNOW HOW TO USE CALCULATOR

$$\frac{dE_{\text{Tidal}}}{dt} = -\text{Im}\{k_2\} \frac{21}{2} \frac{GM^2 R^5 n e^2}{a^6} \quad (26)$$

where

- $-\text{Im}\{k_2\}$ is the imaginary part of the second order love number, with a value of 0.02. That is, $-\text{Im}\{k_2\} = 0.02$
- R is the radius of the moon
- M is the central larger body's mass
- n is the mean orbital motion, which is the angular velocity required for the satellite to complete one full perfectly circular orbit in the same time as its elliptical orbit period
- e is the eccentricity of the satellite's orbit.

You may wish to use any necessary values of the Europa system from part (m).

Parts (g) and

$$= \frac{GMm}{R^2}$$

$$= \frac{G \left(\frac{4}{3} \right)^2 (\pi r_m)^3 (\pi r_m)^3}{d^2}$$

ch) $d_{\text{roche}} = 1.26 R$

$$= (1.26^3)$$

$$= R_m$$

i) $d_{\text{roche}} = 7.149$

$$= 7.149 d$$

$$= 7.149$$

$$\frac{GM^2}{R^2} = 2 R_m \frac{GM_{\text{max}}}{R^2}$$

(j)

$$\text{Roche limit} = 7.149 \times 10^7 \left(2 \frac{1.849 \times 10^{27}}{4.7998 \times 10^{32}} \right)^{\frac{1}{3}}$$

$$= 3069181488 \text{ m}$$

X

Overall:

Definitely a harder qn

Expected most to be able to get parts (a), (c), (g) and (n)

Reality was a little more disappointing.

Overestimated the ability of seniors to do
delta-v calculations

Standard Deviation: 6.081161031

Highest: 19

Lowest: 0

Total score: out of 21

Histogram for Q2

Why this question?

This was Stellar Vista in Jan 2025

The index mirror is a fully reflective mirror that is used to reflect an image of the body you are measuring towards the horizon mirror. The horizon mirror is a partial mirror that enables the user to overlay the reflected image from the index mirror, with the horizon viewed right ahead. When the sextant is lined up, the rays from the object appear to be parallel to the horizon. In this question, the horizon will be considered to have an altitude of 0 degrees.

“I’ve been staring at the edge of the water”

To trick people into thinking this is a history of astronomy question before scaring them away with spherical trigo

Figure 5: The Celestial Coordinate System [1]

Some funny answers

Ah yes, Sirius the pole star.

(c) Which hemisphere are you in and what is the name of this star?

Southern hemisphere, Sirius

(j) What is your current longitude, rounded down to the nearest whole number?

Akshually 🤪

It's an integer.**

its a integer

The Sun on this day currently lies in the constellation of Pisces, and not in Aries.

(g) Why is this the case?

The Greek God Pisces claimed the spring equinox over Aries.

dear port marten viewers
we hope we pass :-:-

Ah yes, the floor is made of floor.

The Sun on this day currently lies in the constellation of Pisces, and not in Aries.

(g) Why is this the case?

because it lies in constellation of pisces

Prove the sunrise equation [5]

Some actual trigo. Gives up.

GYATT

Therefore, $\cos(H) = -\tan(\phi) \tan(\delta)$

The Sun on this day currently lies in the constellation of Pisces, and not in Aries.

(g) Why is this the case?

It is born on the day of Aries constellation.

[1]

Breaking the Fourth Wall

Dear organisers,
Thank you for allowing
us to participate in
AstroChallenge 2025.
We couldn't be more
grateful for this
opportunity despite
our lack of ability to
answer questions. Regardless,
we hope you are entertained
by the answers we have
provided.

Good luck for AC 2026 ☺ ☺

(k) Prove the sunrise equation (Equation 1). [5]
Reminder: please use the appropriate trigonometry laws given in the formula booklet.
Hint: Consider the trigonometric properties of the triangle PZX on the celestial sphere.

Dear astrochallenge,
We love you !!!

Grand Reveal

(m) Just for fun, suggest what island you are on.

Antartica

Page 11 of 1

Part II Look up!

You come ashore to an island with a very clear horizon on all sides, or hills, just beautiful beaches.

At night, since you are stranded on the island, you look up to see stars moving in a circle anti-clockwise about a single point, which is very close to a circumpolar star. The stars seem to move at all over the course of the night, and all other stars seem to move at all over the course of the night.

(c) Which hemisphere are you in and what is the name of the star?

Northern hemisphere /

(m) Just for fun, suggest what island you are on.

Palau. See next page for nothing

HAWAII!

Quite a few teams got this right.

Latitude = altitude of polaris =
 $2 \times \text{index mirror inclination} =$
 $2 \times 10^\circ = 20^\circ \text{ North}$

Longitude can be found using
ratios 1634h UTC at 0600hrs
LST \rightarrow 158 deg West.

ALOHAAAAAAA

Night Sky Talk

Rationale for Night Sky Talk

- Tests your knowledge about the night sky
- Test your presentation skills

Some memorable moments:

- “This is the star Capella, and now we will perform A-capella”
- “This is the moon” (looks at Jupiter)

Some comments

Some tips:

- Purely spamming objects are not engaging
- During preparation, please orientate yourselves and verify any objects that are very very prominent

Most importantly, we hope you have learnt something and please try to practice night sky talk back in school!

It helps with engaging the public when there's an event too!

Day 2: Prac Obs

Governor Larry Hogan ✓ @GovLarryHogan · 10h

Last night, beginning at around 9:45 pm, I personally witnessed (and videoed) what appeared to be dozens of large drones in the sky above my residence in Davidsonville, Maryland (25 miles from our nation's capital). I observed the activity for approximately 45 minutes.

...

[Show more](#)

Preface

- Owing to the less than ideal weather, the Cloudy Weather plan was used for the first time in a while
- We actually ended pretty much on time (a first), thanks for cooperating!
- Teams were generally quite prepared and adapted well to the plan

Join

Another horrid abomination perverting
another otherwise beautiful view of
Yosemite Valley

Section A: Set-up

- Most teams breezed through this section with full, or almost full marks
- Mistakes made were either careless or very minor
- HOWEVER... There was a serious safety infraction during the round

Lessons learnt: Safety Incident on 6/6/25

Summary: A team was unfamiliar with their scope, leading to a lack of procedural knowledge on how to set it up. Several unsafe procedures were made, the most serious being when the scope almost fell off the tripod during the round.

Comments:

- 1) We aren't going to crucify you if you're not sure about something. We are here to help you, not to kill you.
- 2) You want to be safe, we want you to be safe. Injuries are painful and make us sad.
- 3) Marks are important, but are they more important than your non-broken foot?
- 4) Familiarise yourself with your scope! Remember that unsafe setup is a disqualification!
- 5) I think five is a nice number. This isn't an actual point.

Section B: Boresighting

Mean: 76.36

Median: ???

Mode: ??

- Two teams got maximum points, well done!
- We unfortunately do not give credit for boresighting a moving plane
(you know who you are)
- We may be considering a different boresighting test next year for cloudy weather
(this may or may not involve a moving human)

Section C: Marathon

- Most teams managed to really score in this section
- 3 teams managed to get above 200
- 8 teams (73%) managed to get above 100
- Several strategies were employed with varying success
 - Open cluster spam was used by most higher-scoring teams
 - However, the top 4 all found several galaxies boosting their scores even further
 - Finding stars is relatively easier but has less point weightage

Mean: 161.32

Median: 175

Mode: everyone got a different score so there isn't one

Finals (finally!)

Released video:

the judges hearing random nonsense coming out during
buzzer round

Alright so if you've liked this video remember to like, share and follow!
